WELL 6506/12-1 - GEOLOGICAL SUMMARY

1.0 STRATIGRAPHIC SUMMARY

The well was spudded into Pleistocene/Holocene seabed sediments and penetrated a normal Cenozoic and Mesozoic succession. The main reservoir target, the Garn/Ile Fm., was encountered at expected regional depths, exhibiting high net-to-gross sand ratios.

2.0 HYDROCARBON SHOWS & CORE RECOVERY OVERVIEW

Continuous coring was initiated in the upper Garn/Ile Fm. section. Core cut recovery was exceptionally high (>90% average), yielding high-quality unweathered plug samples. Visual examination confirmed strong live hydrocarbon shows, yellow fluorescence, and fast cut-fluorescence in the porous sandstone intervals.

3.0 RESERVOIR LITHOLOGY NOTES

Sandstones are light grey to yellowish-brown, fine to coarse-grained, subangular to subrounded, moderately to well sorted, with subordinate calcite and kaolinite cementation. Interbedded siltstones and claystones are dark grey, carbonaceous, and moderately micaceous.

Detailed tabular coring intervals, cut lengths, and recovery statistics are tabulated on the following Enclosure (Core Log Summary).

CORE LOG

Norsk Hydro

SCALE : 1 : 200

WELL : 6506/12-1 **DATE : 05/1986**

COUNTRY	Norway
LICENCE	PL094
FIELD	Smorbukk
OWNERS	Saga Petroleum, Statoil, Deminex
COORDINATES	GEOGRAPHICAL N64°42'28.74" E06°35'59.94"
ELEVATION KB	23m
WATER DEPTH	201m
TOTAL DEPTH (DRILLER)	4720m
TOTAL DEPTH (LOGGER)	4724.5m
FORMATION AT TD	Are fm.
LOGGERS - DRILLERS	Cores 1-6: -0.5m
GEOLOGISTS	S. Olaussen, T. Svana
COMMENTS	Core recovery verified against gamma log readings.

GROUP/FORMATION: Garn/Ile Fm.
AGE: Mellom Jura
